The Impact of the Minimum Wage on DI Participation

Gary V. Engelhardt Syracuse University

21st Annual SSA Research Consortium Meeting
August 1, 2019
National Press Club
Washington, D.C.

Introduction

- This project provides an empirical analysis of the impact of the minimum wage on DI claims
- The minimum wage affects the value of labor-market work relative to DI
 - Raises the opportunity cost of being on DI for those not truly disabled
- However, increases in the minimum wage cut both way
 - Raise hourly wages
 - May decrease employment and hours for low-skilled workers
- Overall impact on DI participation is theoretically ambiguous

Introduction

• This project answers the following question:

"Do changes in the minimum wage find their way in the short run into changes in DI claims and awards?"

Introduction

• And the answer is no

Summary of Data and Methods

- Draw on data from the SSA's State Agencies Monthly Workload Data
- State-by-year panel of DI claims and allowances for 2002-2017
- Matched to state-by-time variation in the real effective minimum wage

Summary of Data and Methods

- Two reduced-form estimation methodologies are employed
- The first follows studies in the hourly wage-inequality literature
 - models DI claims as a function of the bindingness of the log minimum wage in the state hourly wage distribution
- The second follows studies in the disemployment literature
 - models DI claims as a function of a distributed lag of the minimum wage

Summary of Findings

- Across a wide variety of specifications, the minimum wage has had no net effect in the short run on DI claims and awards over the last two decades
- Estimated elasticities of DI claims and awards to the minimum wage are
 - Economically small
 - Not statistically different from zero
- Policy proposals to increase the minimum wage would be predicted to have no discernable impact on DI claims and awards

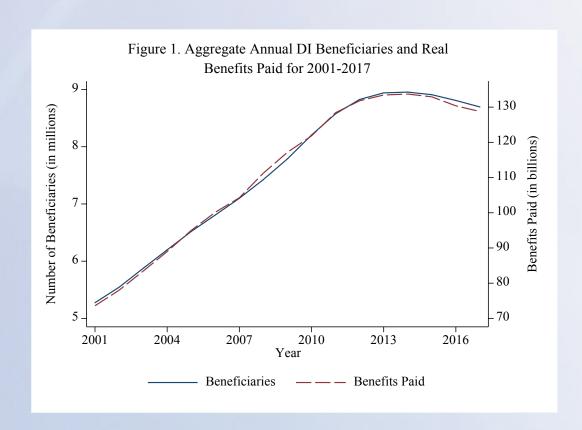

Background

- MW can affect DI participation in the short run in a number of dimensions
 - Increase the likelihood of attaining a quarter of coverage and over time
 - Increase the likelihood an individual will be insured for DI benefits
 - Conditional on being insured, increase the likelihood earnings exceed SGA
 - Reduce the likelihood an insured individual is eligible for DI benefits
 - Conditional on being eligible, increase earnings
 - Decrease the replacement rate from DI
 - Increase the opportunity cost of DI participation

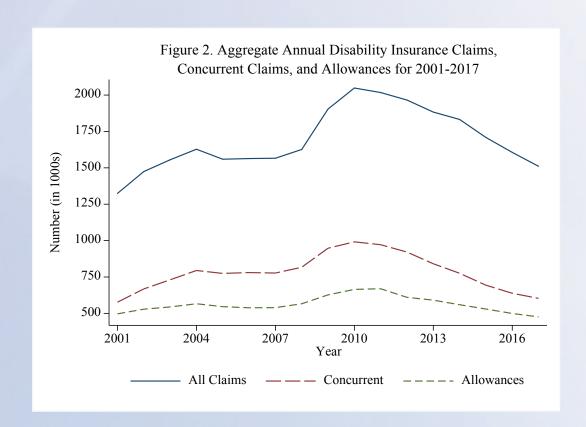

Background

- Employment/hours adjustments complicate the potential impact on DI
- If minimum wage reduces employment for the low-skilled, DI becomes more attractive relative to labor force participation
- Overall, the impact of a change in the hourly wage, such as that induced by a change in the minimum wage, is theoretically ambiguous
- Empirically, claims are strongly counter-cyclical

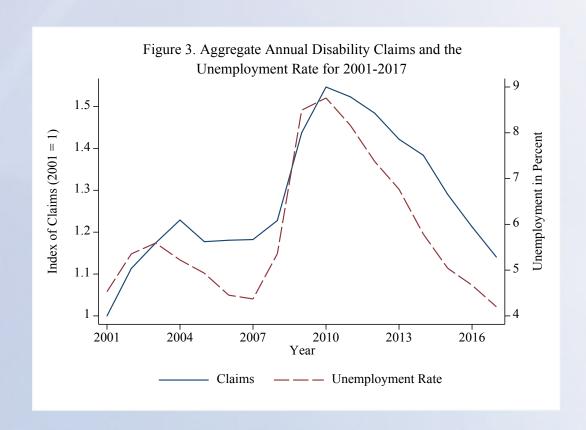

Claims are Strongly Counter-Cyclical

Claims are Strongly Counter-Cyclical

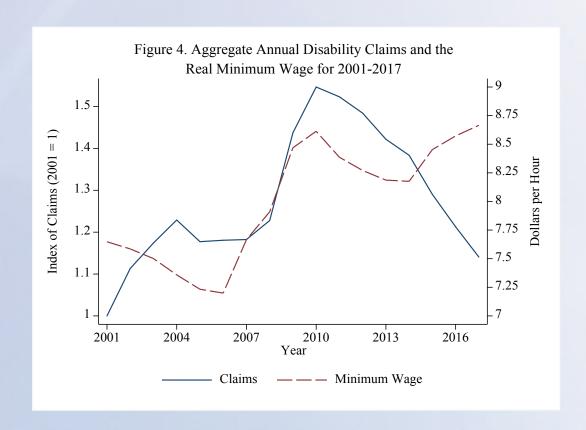

Claims are Strongly Counter-Cyclical

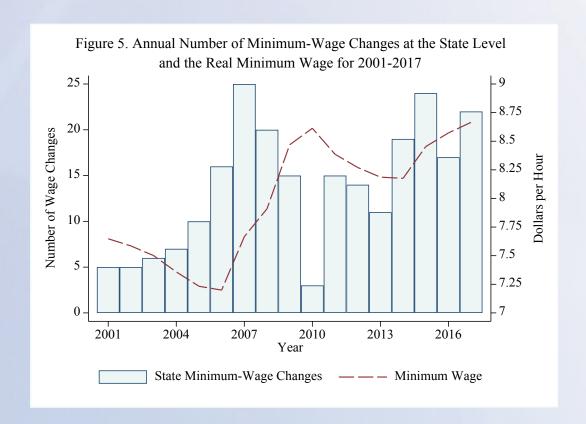

Evidence from Natural Resource Booms and Busts

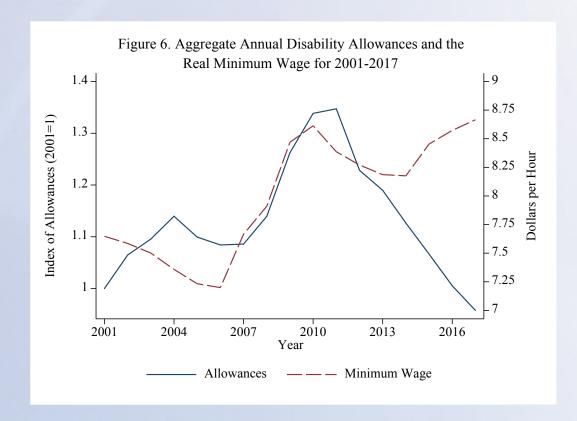

- Black et al. Coal boom in Appalachia
- Vachon Fracking boom in Bakken Basin
- Charles et al. Fracking boom nationally
- Elasticity of DI payments with respect to earnings of -0.3 to -0.7
- Elasticity of DI participation with respect to earnings of -1

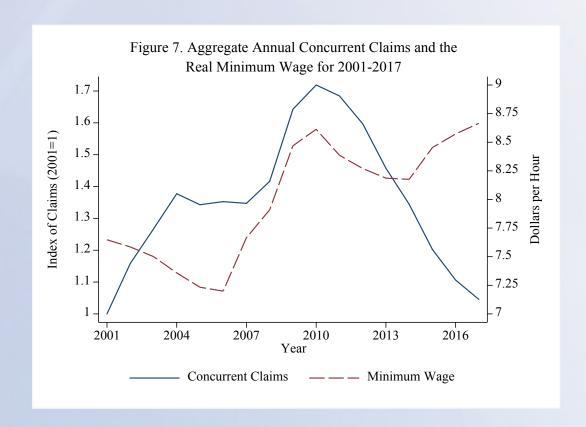

- Unfortunately, the results of these studies are not directly applicable to the impact of the minimum wage
- Resource booms (busts) represent shifts in labor demand
- MW changes represent movements along labor demand curve
- Previous studies have focused on DI payments, not claims

- Variation in real minimum wage from
 - Federal changes in 2007 (\$5.85), 2008 (\$6.55), and 2009 (\$7.25)
 - State changes

- No clear time-series evidence
- But there have been many secular changes to labor demand and supply
 - Continued de-unionization
 - Increased automation
 - Skill-biased technical change
 - International competition
 - Outsourcing
- Move to a regression-based framework
- Use a state-year panel and two estimation methodologies

First Econometric Method

$$\underline{d_{st}} = \alpha + \beta_1 \underbrace{(w_{st}^{MW} - w_{st}^{50})}_{\text{Wedge between MW and median wage}} + \beta_2 (w_{st}^{MW} - w_{st}^{50})^2 + \underbrace{\mathbf{X}_{st}}_{\text{Other factors changing within states over time}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State & Year Effects, State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s \cdot t}_{\text{State x Year Trends}} + \underbrace{\psi_s + \tau_t + \psi_s + \psi_s$$

- Measured in logs
- State (s) and year (t)
- Impact on DI is a function of bindingness of MW
 - Modeled as a quadratic
 - Relative to median wage in the state (in each year)

Second Econometric Method

$$\ln d_{st} = \kappa + \sum_{r=-1}^{3} \delta_r \ln w_{st-r}^{MW} + \mathbf{X}_{st} + \psi_s + \tau_t + \psi_s \cdot t + u_{st}$$

- Employment and DI claims may take some time to adjust
- Distributed lag approach
- 3 lags and 1 lead of the MW

Take-Aways

- Across a wide variety of specifications, the minimum wage has had no net effect in the short run on DI claims and awards over the last two decades
- Even for concurrent claims (and SSI-only claims)
- Estimated elasticities of DI claims and awards to the minimum wage are both economically small and not statistically different from zero.
- Policy proposals to increase the minimum wage would be predicted to have no discernable impact on DI claims and awards
